

## Technology Stack:

TEAM ID	LTVIP2025TMID30940
PROJECT NAME	Asset Management portal

### Architecture of Servicenow

- Scheduled imports in service now are used to automate the process of importing data into the platform at specified intervals.
- Import sets are a feature used to bring data into the platform from external sources.
- A transform map defines how data from an import set is mapped and transformed into a target table.

- Incident table is a core table used to track and manage unplanned interruptions or degradations in IT service quality.
- CMDB(Configuration Management Database)utilizes several core tables to store and manage information about IT assets and their relationships.
